TRANSIVA · NUTANIX EXIT

Out of Nutanix in minutes.

One script takes a VM out through Prism v4 and boots it on plain KVM and KubeVirt.

THE RUN

Measured, not promised.

One unattended run, results saved as `results.json`.

7/7
stages passed

145 s
download to two running guests

0%
packet loss to the guest

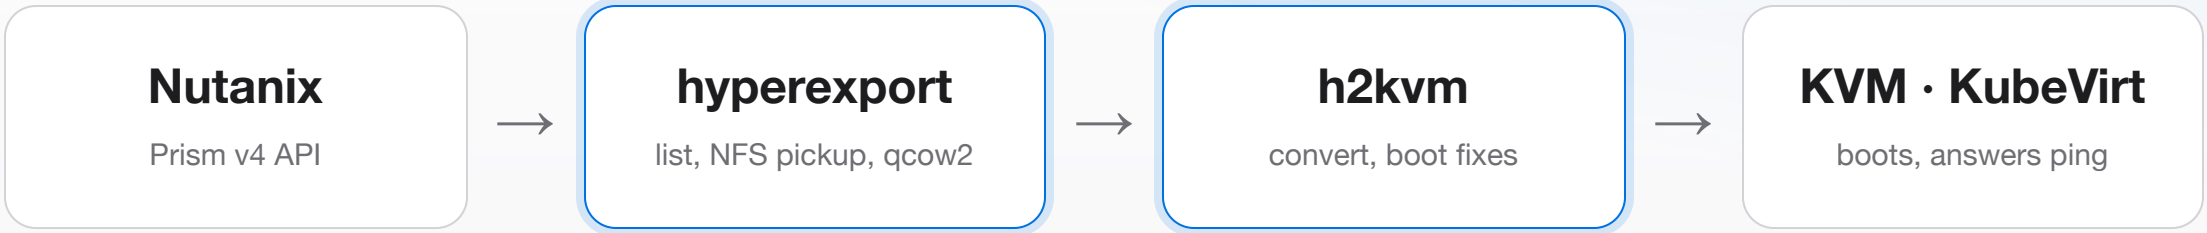

1
command

Prism endpoint is Chimera's Nutanix simulator

HOW IT WORKS

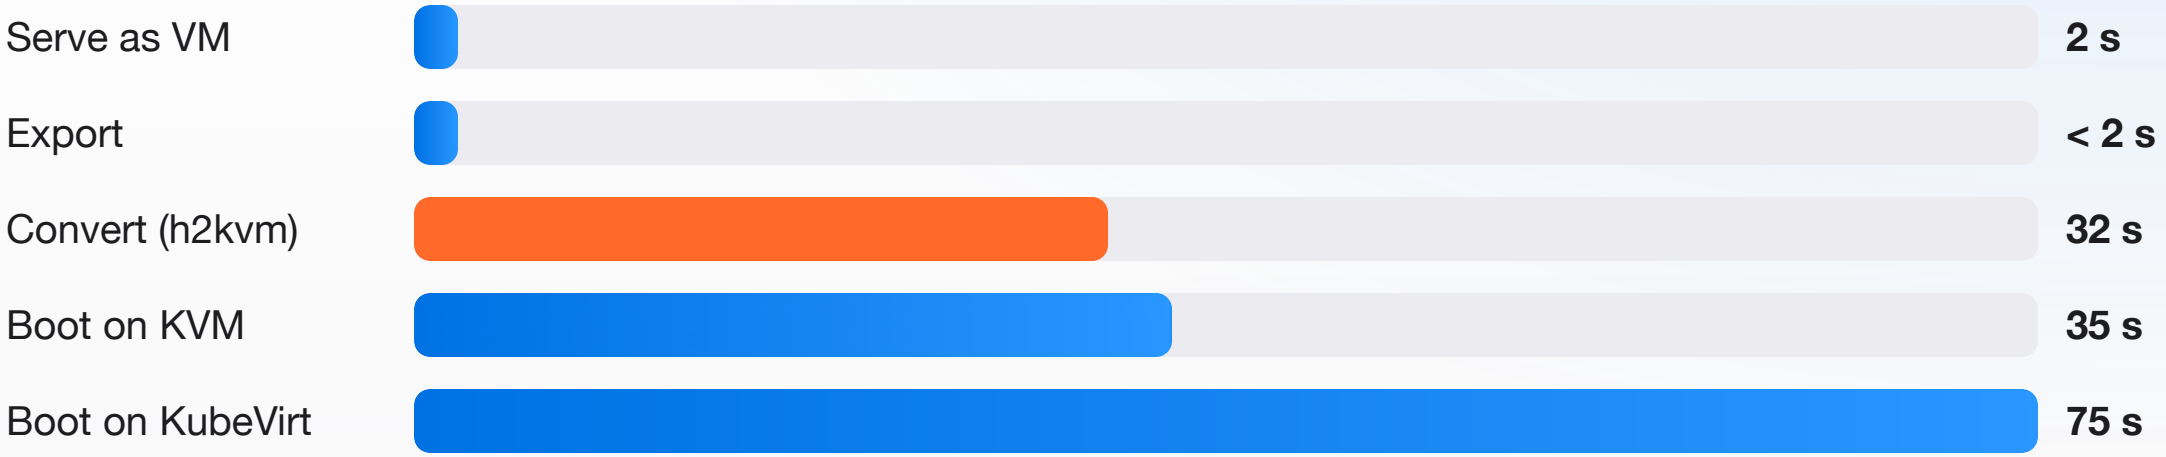

Four hops. All standard.

The source VM is never modified. The artifact is a plain qcow2 plus a manifest.

TIMINGS

Where the 145 seconds go.

Convert took 150 to 198 s on a heavily loaded host in earlier runs. KubeVirt includes building and importing the container disk.

DESTINATIONS

Land it where you want.

Linux KVM	KubeVirt	Zorvia	Kairon	Machina
Verified	Verified	Verified	Not run yet	Not run yet
		by hand		

Nothing is claimed until it has been run

STRAIGHT TALK

What it does and doesn't prove.

Proven

- Prism v4 export, end to end
- Valid qcow2 and manifest
- Boots on KVM and KubeVirt
- Repeatable, unattended

Not yet

- A real Nutanix cluster
- Windows, UEFI, multi-disk, large VMs
- Guest repair (skipped here)
- Checks beyond ping

```
$ ./scripts/e2e-nutanix-exit.sh user@kvm-host
```
